

# Results and Discussions

- A 1 standard deviation increase in dynamic complexity is related to a 55% increased change for a sudden gain or loss in the upcoming 4 days

Early-warning signals have real-time predictive value for sudden gains and losses

Sudden gains and losses are likely to represent transitions within a patient

- Predictive early-warning signals can be used in clinical practice to identify periods of instability within a patient's change process

# Results and conclusions

- A 1 standard deviation increase in dynamic complexity is related to a 55% increased change for a sudden gain or loss in the upcoming 4 days
- Early-warning signals have a real-time predictive value for sudden gains and losses
- Sudden gains and losses are likely to represent order transitions within a patient
- Predictive early-warning signals can be used in clinical practice to identify periods of instability within a patient's change process

Thank you for your attention!
